

[NS120]

N Scale Kits Welded Rail with Bunks [NS120]

Bunks for 5 cars are supplied
BNSF on far left,
cross bunks on right
UP/SP on the right
NS on the far right

The rail is supplied in a
continuous 50' coil - see below
for advice.

Glue the cross bunks into the pockets as shown. CA glue is recommended, but other glues can be used.

Fix the bunks to an appropriate consist of flat cars. The bunks will fit a wide range of available flatcars. N Scale Kits supply metal flatcar kits in use by a number of roads.

Holes can be drilled into the cars to receive the bunks - or the spigots can be cut off and the bunks filed flat

When the bunks are in position, the welded rail can be threaded through the bunks. The plastic will have developed a coil in transit. We suggest that rail is uncoiled as soon as possible after delivery. The plastic rail can be straightened by hand, using warm water will help this process. It is possible to spot glue the rail to a fixed point, but remember that the rail will move on the bunks as it moves around curves. This could mean a movement of up to ½ inch when travelling around a 12" radius curve.
